Abstract

No. 19 Passmore Street, London, UK

Data of building | Gebäudedaten

Year of construction	2015	Space heating	24.8
U-value external wall	0.099/0.193	Heizwärmebedarf	kWh/(m²a)
(new/ existing)	W/(m²K)		
U-value ground (new/	0.121/0.168	Drimary Energy Renowable (DER)	-
existing)	W/(m²K)	Primary Energy Renewable (PER)	kWh/(m²a)
U-value roof (new/	0.101/0.111	Concration of renowable Energy	-
existing)	W/(m²K)	Generation of renewable Energy	kWh/(m²a)
U-value window	0.90	Non renovable Drimory (DE)	128
	W/(m²K)	Non-renewable Primary Energy (PE)	kWh/(m²a)
Heat recovery	87 %	Pressurization test n ₅₀	0,90 h ⁻¹
Special features	build up & save wall insulation	ble Aerogel internal wall insulation to preve e space in this high market rental property with brick slips & triple glazed mock-sash e in conservatopn area of Westminster (se r Planning).	r; EPS external window used

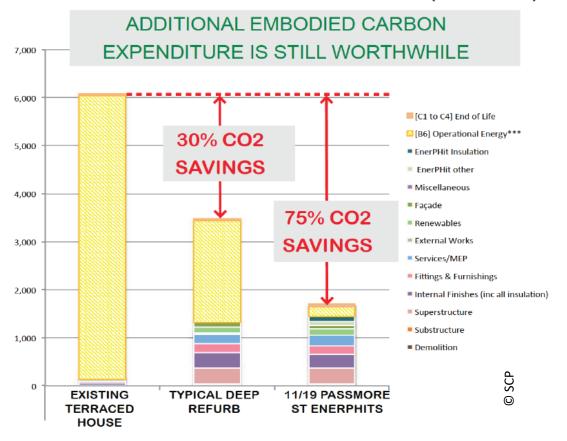

Background and description

First development of its type completed by Grosvenor Britain & Ireland (private landlord with portfolio of over 6,000 houses in Central London). This project was identified as 'pilot', as part of the company's commitment to reduce their carbon emissions by 50% across their directly managed property portfolio by 2024.

The historic fabric of the building was carefully preserved while being reinforced and insulated, using super-efficient breathable aerogel internal insulation to front, and external EPS wall insulation with brick slips to rear (applied to the whole street of 12 terraced houses). Two houses on the street no.11 and no.19 were identified for EnerPHits as were vacated at the time and undergone deep retrofit.

Whole Life Carbon Assessment showed that compared to existing, the two EnerPHit buildings achieve 95% operational CO2 reductions and 75% whole life CO2 reductions (including embodied emissions of materials), giving an overall saving of 840,000kg CO2e over buildings' life (60 years).

When completed it was only the second EnerPHit ever completed in the UK and the first rental property that was earmarked for PassivHaus certification.

WHOLE LIFE CARBON ASSESSEMENT (60 YEARS)

5. Internal insulation - rear

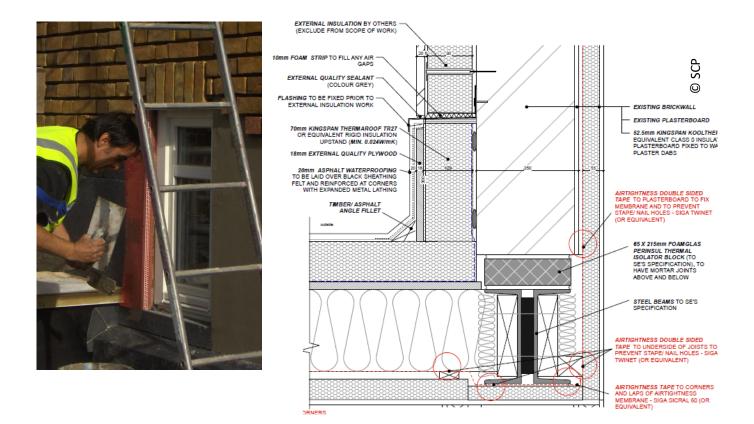

We have opted for a unique product to insulate external walls – vapour permeable Aerogel high performance insulation board sandwich with intellegent airtightness membrane in between. It was necessary to avoid problems with condensation and to save space internally. We opted for thinnest vapour permeable product on the market and were guided by the manufacturer on installation. The fixings were the trickiest part as you cannot drill aerogel because of its fibrous nature. It had to be punctured & only then masonry wall drilled inside protective hollow tube. Mastic had to be used during the application of fixings to ensure membrane was not leaking. Furthermore, the board had to be pre-drilled to countersink the mashroom fixing head which reduced the thermal bridging.

6. External insulation - rear

External insulation allowed us to save space internally but was difficult to get through Planning with the local authority. We had to install it with the brick slips over the top to match the existing exactly. It also had to be applied to the facade of all adjacent houses (12no.) and all historic details such as corbing had to be replicated which lost us some battles with cold bridging but won the Planning battle! We were still limited with the amount we had permission to install and had to resort to some internal insulation to improve the u-value.

7. Roof construction

This was an existing property with a sizable new extension on the back. We were limited with what we could do with existig floor because of the existing shallow foundations so the main house had only 125mm insulation and new slab installed, when the new part of the building which was at lower level compared to existing had 175mm insulation laid down (as per u-value calc below). It was a balancing act between what you can get away with in existing part and how far we could push the envelope with new elements.

9. Airtightness

The airtightness n50 of 0.80 and 0.90 h-1@50Pa was achieved in the two tested properties with a fair amount of rectification measures.

The airtightness was the hardest item on the contractor's list because of the luck of experience, and was only achived due to:

(1) Very clear approach where all drawings were marked with red for airtightness where membrane went and how it was taped (specialist tapes were used for different areas);(2) Hands-on workshop from Siga held with the contractor;

(3) Second hand air testing equipemnt was purchased by the client to be used by contractor who had to learn to operate the machine to keep an eye on the airtightness throghout the build;

(4) Due dilegence of the PH designer/ Architect who came to every air test and helped to rectify the faults.

We used certifed MVHR unit to ensure that we comply with the PH requirements. Our system was designed by supplier, installed by professional and tested by third party. Air ducts info included on GA plans above.

Manufacturer	Paul Focus 200
Efficiency	91 %
Electric efficiency	0.31 Wh/m³

The heating was provided by Vaillant Combi boiler which was a familiar choice for the contractor and client who wanted a traditional suystem installed bearing in mind that this property required regular servicing as it was a rented property.

11. Monitoring

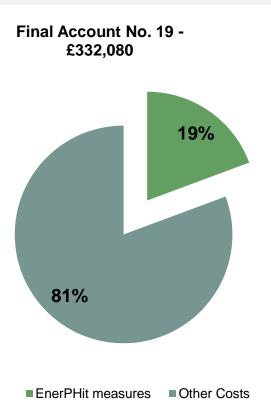

A number of monitoring devices were installed in the property to monitor in-use electric energy meter, hot water & heating flux meter, internal & external temperature sensors. The data was collected and analysed by SCP.

12. Renewables

PV panels were installed on the property but subsequent to the certification and were not included.

13. Construction cost

EnerPHit requirements where more onerous than the given budget resulting in the uplift in cost. The contractor did not make allowance for either extra time required to achieve desired airtightness and attention to detail that was required. Prelims went up to account for 4 week extension of time.

Extra Cost attributed to EnerPHit estimated = £60,350 (19%) N.B. This is one of the most expensive London addresses and the work budget and costs reflect this.

We considered this a very high uplift which will be negated in any consecutive projects providing the same team is used and lessons learned are taken forward.

This was one of the first EnerPHit projects in the UK and the learning curve was steep for both PH designer and certifier. We had to allow for error in all calculations and assume worse performces for insulation & windows during design stage. The building was small and the client was concerned for every m2 of area lost to internal insulation. It was a real balancing act to get the insulation right!
